

PRESYMPTOMATIC individuals or individuals with VERY FEW SYMPTOMS of FRIEDREICH'S ATAXIA
age 10 and above needed for an MRI study
to evaluate the chemistry and connectivity of the brain and spinal cord in Friedreich's ataxia
at the Center for Magnetic Resonance Research at
University of Minnesota

Recruiting:

- 1) Individuals who have tested positive for Friedreich's Ataxia with a genetic test, but do not show any symptoms (e.g. younger siblings of an individual already diagnosed with Friedreich's Ataxia)
- 2) Individuals just diagnosed with Friedreich's Ataxia who can walk without any support

You will lie in the scanner for ~1.5 hour while listening to the music of your choice.
Reimbursement for travel expenses is available and you will be compensated for your time.
